# Agenda

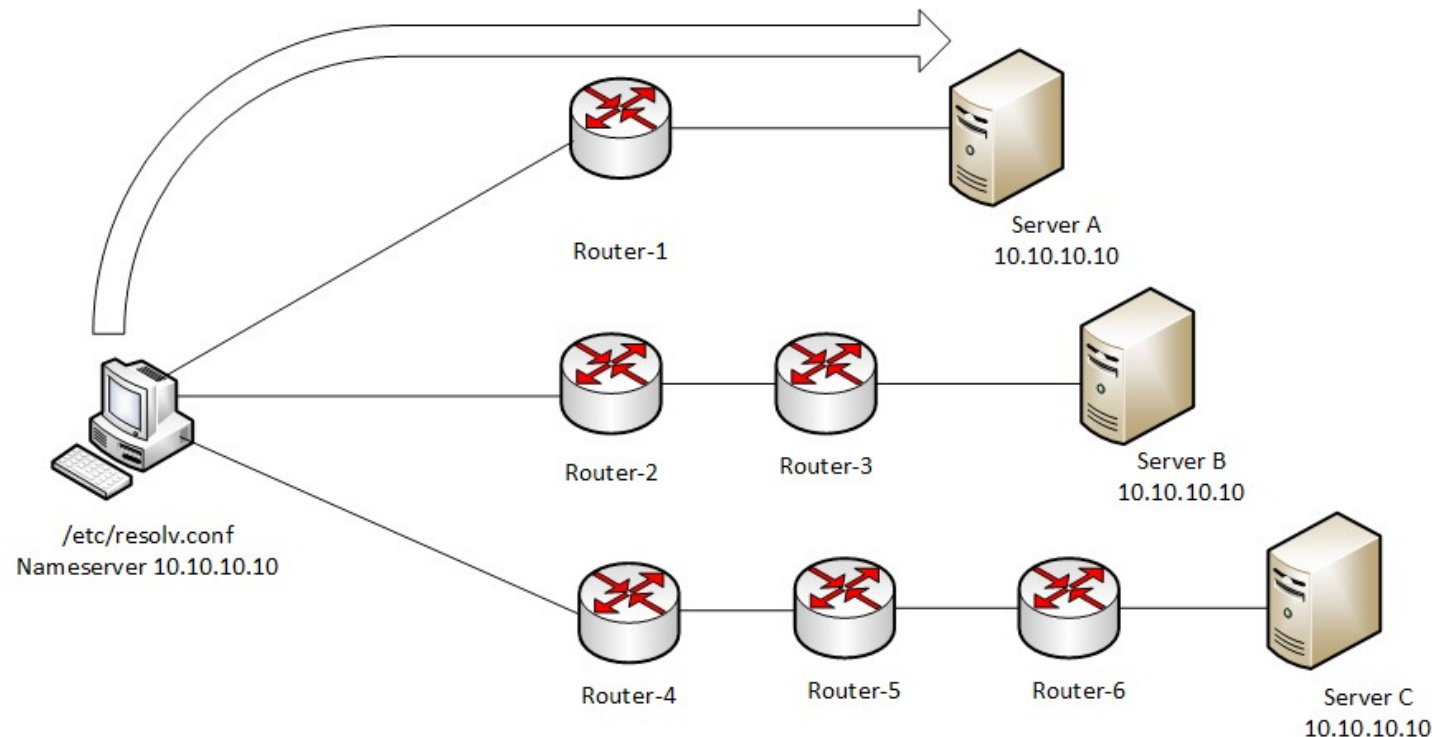

- How to deploy IP Anycast for Recursive DNS service with a implementation case study.

# What is Anycast ?

Anycast is a routing method in which incoming requests can be routed to a variety of different locations. Based on the location of the user request, the routers send it to the machine in the network that is closest

# What is Anycast ?

Anycast is a routing method in which incoming requests can be routed to a variety of different locations. Based on the location of the user request, the routers send it to the machine in the network that is closest

# What is Anycast ?

- Unicast refers to 1-to-1 conversations
- Multicast refers to 1-to-many conversations
- Anycast refers to 1-to-any conversations.

What isn't Anycast ?

- 
- Not a protocol, not a different version of IP.
  - Doesn't require any special capabilities in the servers, clients, or network.
  - Doesn't break or confuse existing infrastructure.

# Why Anycast is Important?

- Anycast is designed for short queries.
- Anycast provides a level of redundancy.
- The overall service can be insulated somewhat from Denial of Service Attacks
- The service scales very well.
- Traffic is routed to the server that is the closest (best path).

# How Anycast works ?

The basic idea is –

- Multiple instances of a service share the same IP address.
- The routing infrastructure directs any packet to the topologically nearest instance of the service.

**Lets have an example**

# Example – IP Anycast

# Example – IP Anycast

# Example – IP Anycast

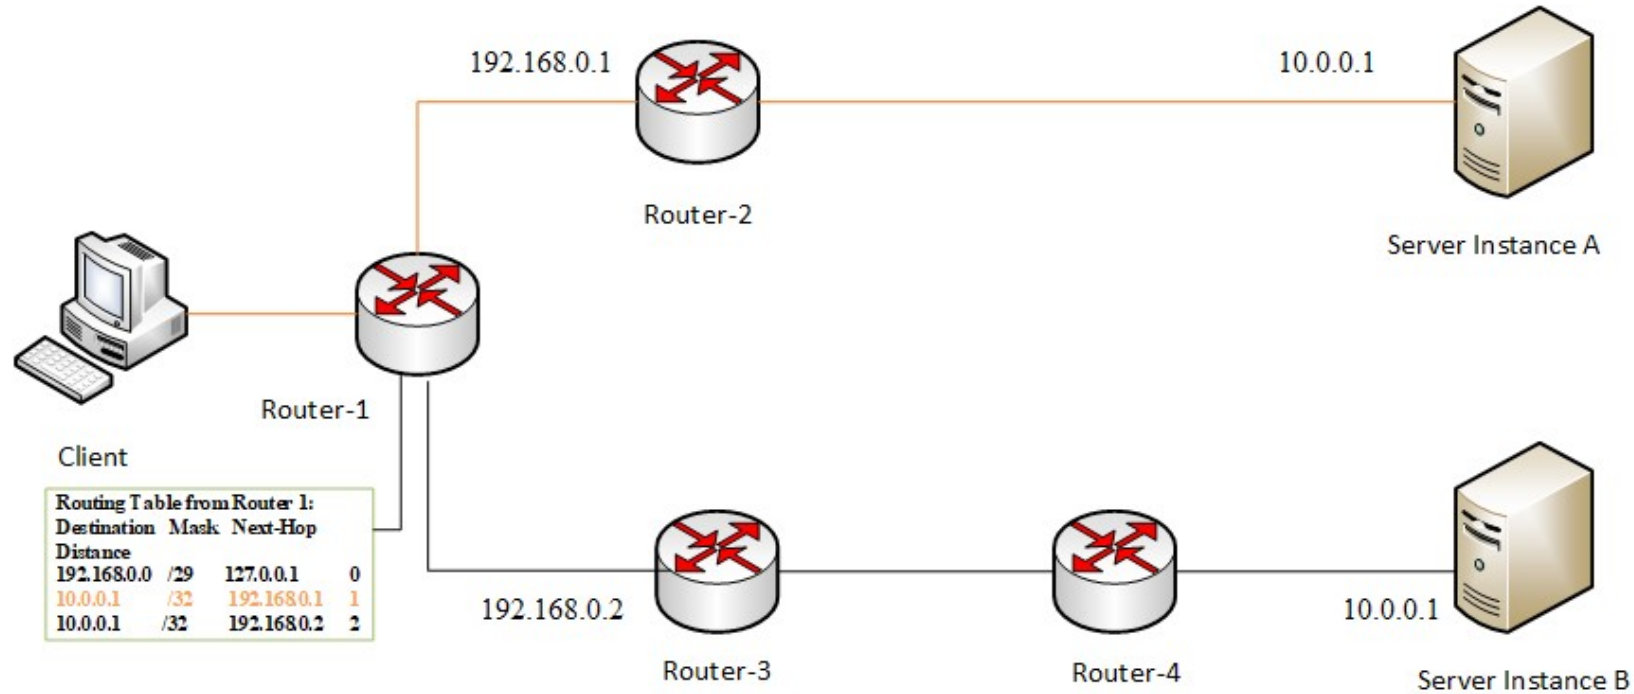

# Example – IP Anycast

# Example – IP Anycast

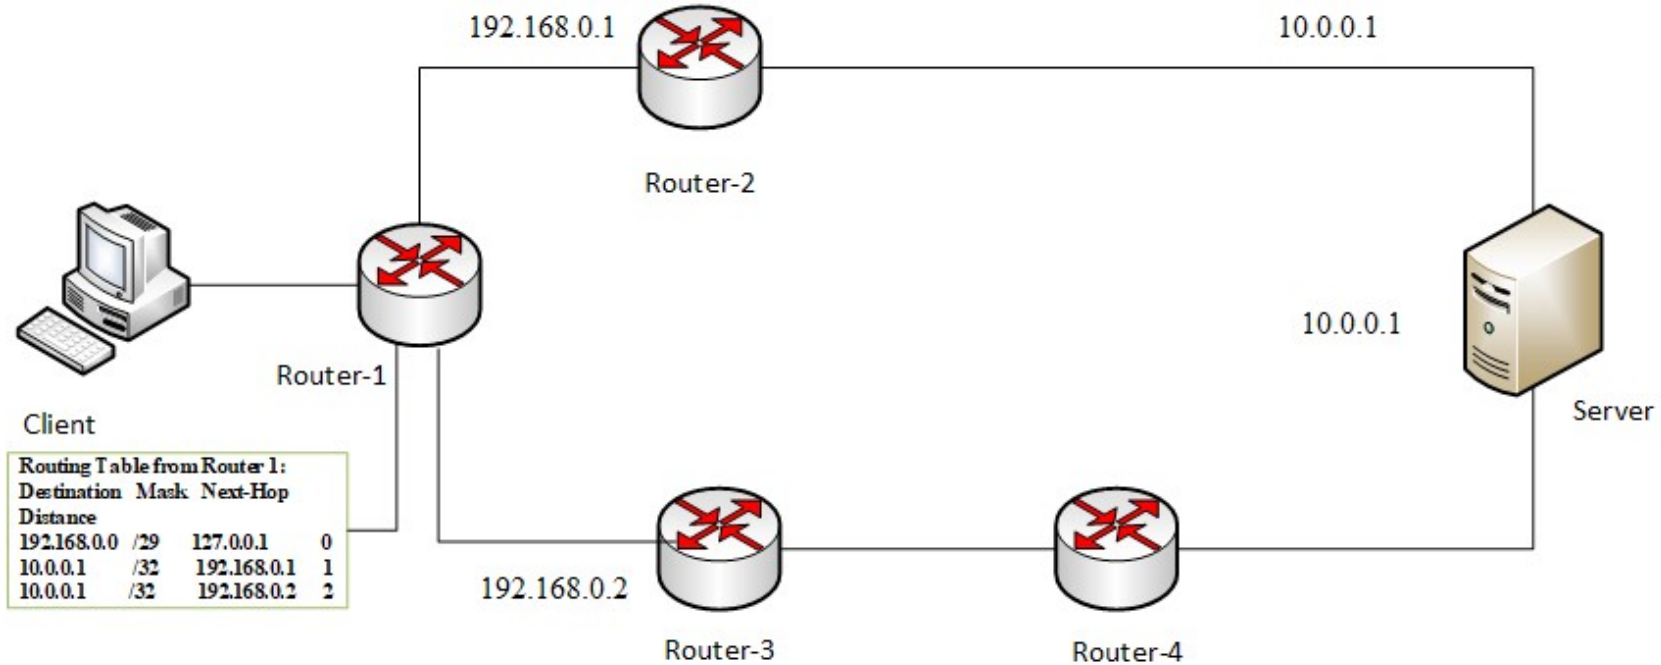

# Example – IP Anycast

# Example – IP Anycast

# Network Topology – in consideration

Where to place???

- user density
- network architecture
- service policy

# What is DNS ?

“The Domain Name Server (DNS) is the Achilles heel of the Web. The important thing is that it's managed responsibly.”

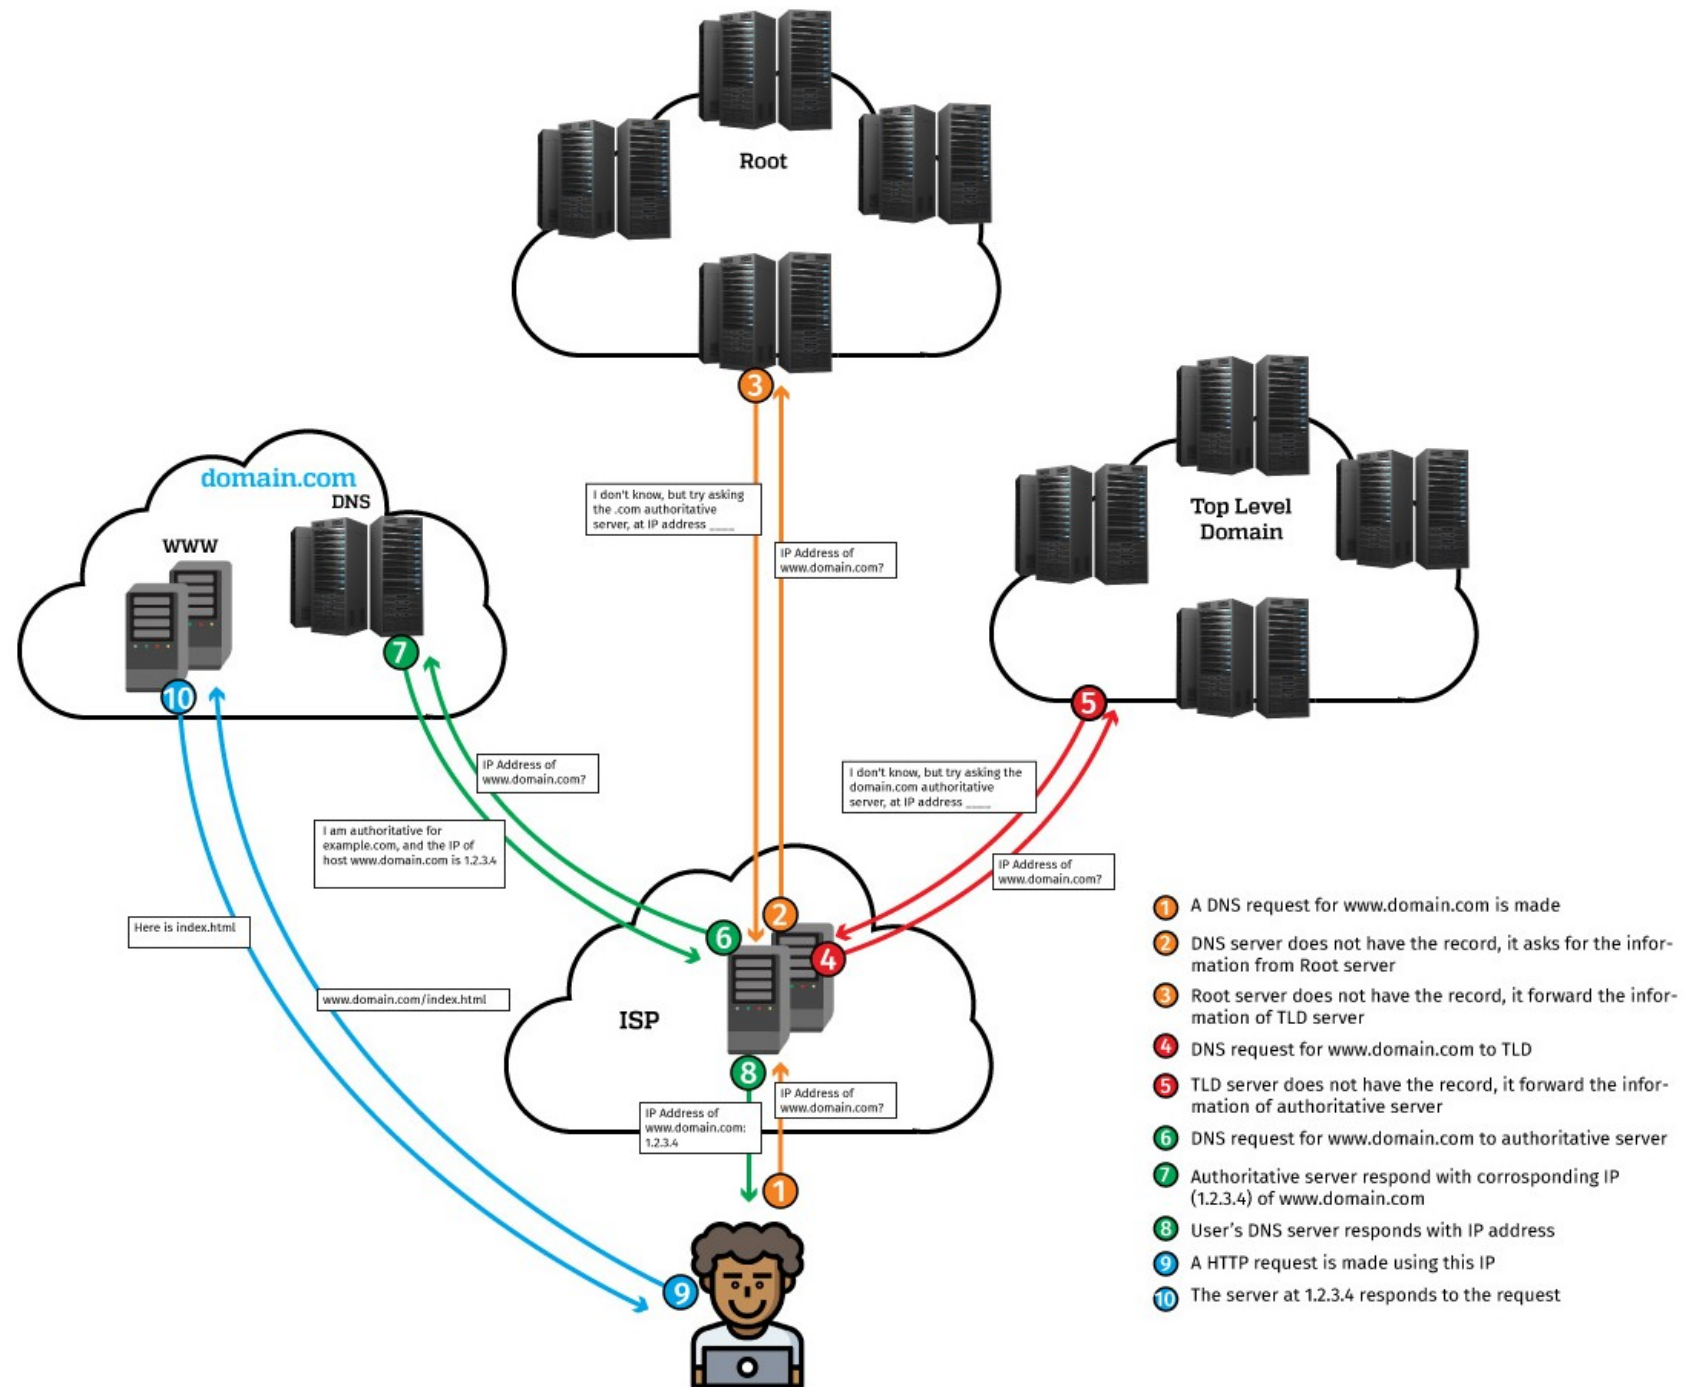

– Tim Berners-Lee

“DNS is mission-critical to all organizations that connect to the internet. DNS failure or poor performance leads to applications, data and content becoming unavailable, causing user frustration, lost sales and business reputation damage.”

– Bob Gill, Gartner, Inc.

# How DNS works?

—  
“walking the DNS tree”

# Recursive DNS – things for consideration

- DNSSEC validation should be enabled
- **chroot** the DNS service
- **allow-query** should be restricted
- **allow-recursion** should be restricted
- Tell everyone about the version, NOT!!!
- **recursive-clients** connection should be mentioned according to the resources
- TCP socket connections should be limited
- **max-cache-size** should be defined, calculating with RAM resources
- Caching controller have to be there
  - mx-cache-ttl, Positive responses should be focused
  - mx-ncache-ttl, Negative responses can not be overlooked
  - min-refresh-time & min-retry-time, also plays vital roll for Caching Recursive DNS system

# Anycast Documented

- Concept discussed in RFC 1546
- Operational experience is evolved with the current practices
- Evolution is briefly documented in RFC 2101
- Anycast DNS noted in RFC 2181
- Anycast authoritative name service at RFC3258

# DNS Anycast at an ISP

Implementation Case Study for Link3 Technologies Ltd

# Why we choose DNS Anycast – issues we faced

1. Existing DNS server OS version was about to obsolete
2. Resource utilization was always 95%-99%
3. When server was attacked with DDOS
  - a. Query response delayed & most of the cases it stopped answering
  - b. Unstable DNS service for user internet access
4. Log search was not administration friendly
5. No log options for Recursive query

# Why we choose DNS Anycast

## Because

- We need to have 1 single IP for the Recursive DNS server all over Bangladesh.
- As we are also expanding our network infrastructure, we didn't want our zonal internet user to be depended on our Central Data Center based DNS system.

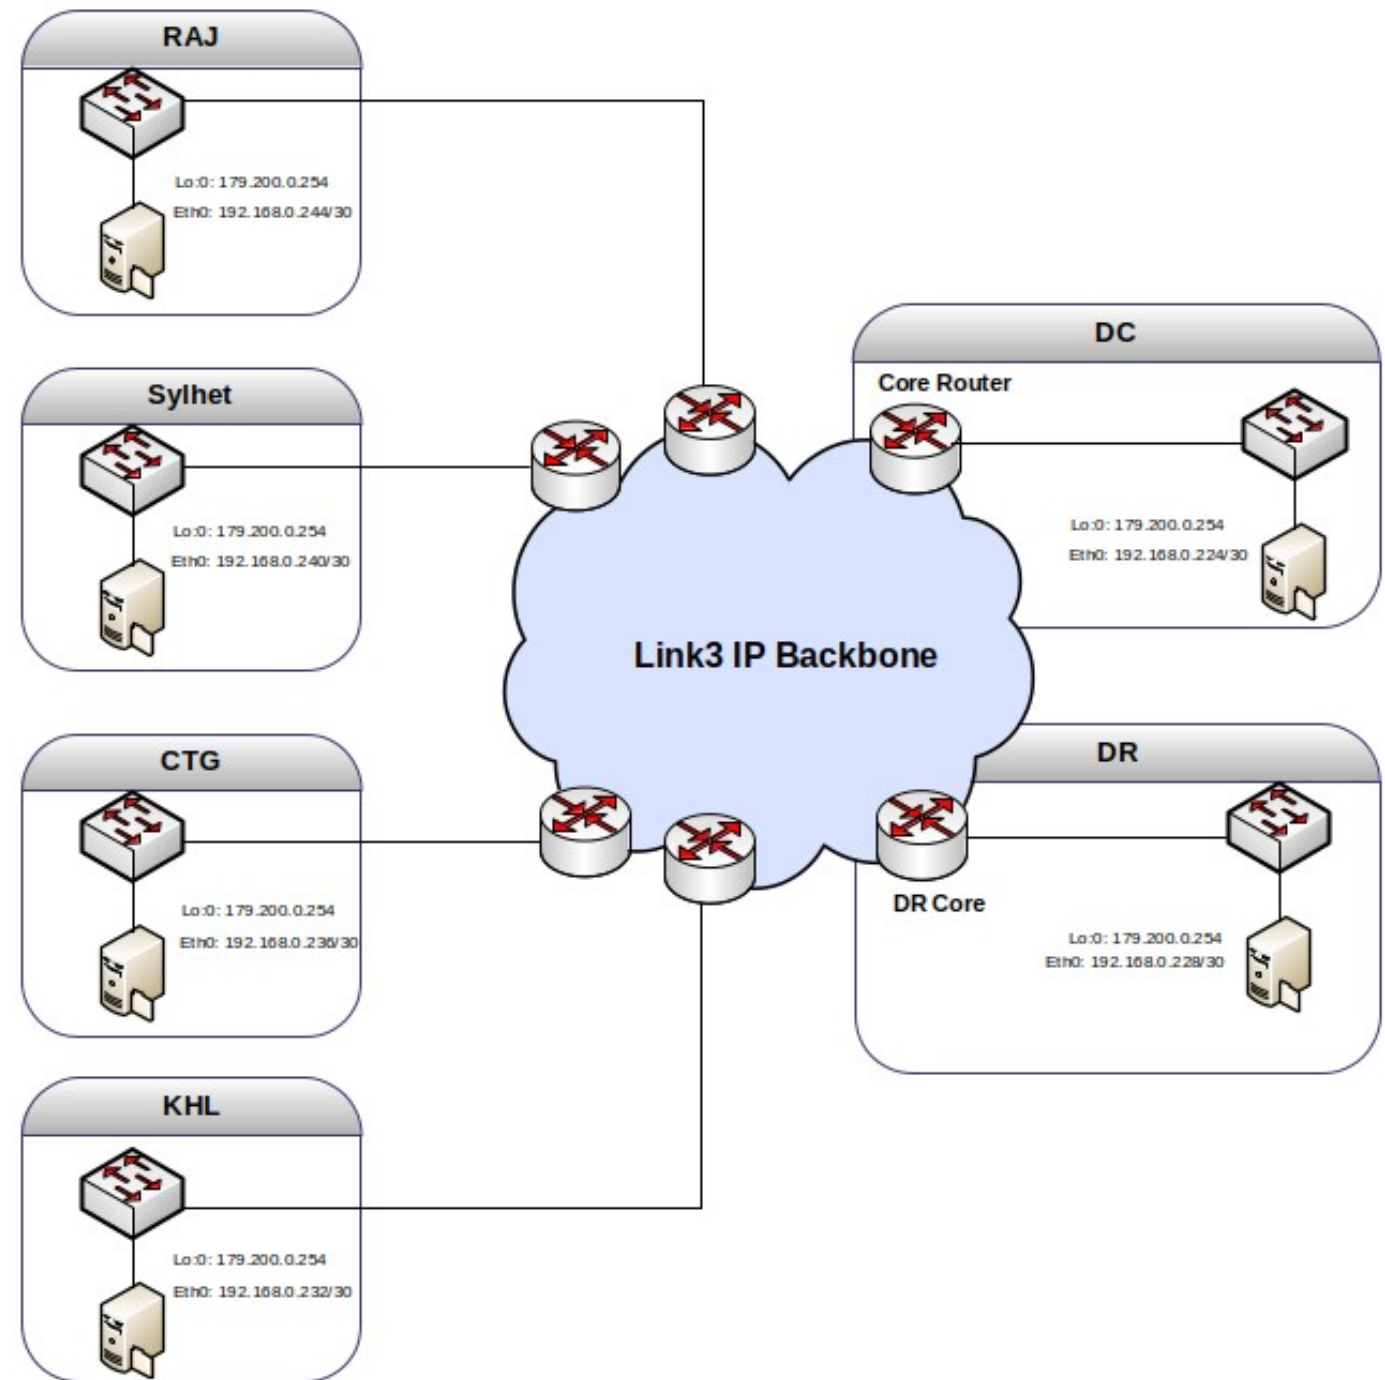

# Decision we have taken

- The network topology and location of users should be considered
- The infrastructure restrictions also play a major role
- Main targets high availability and optimal (given the restrictions) load distribution
- Updated service package and OS have to there
- Divide the Authoritative & Recursive in to TWO server
- Deploy the IP Anycast for Recursive DNS only
- Configure the caching log based on search criteria

# Resources we have used

Software Resources	Hardware Resources
CentOS 7.5 64 bit	CPU - 4 core with 2 Socket RAM – 4 GB DDR4 HDD – Sata SAS 15k RPM
rpcbind-0.2.0-44.el7.x86_64

# Anycast Infrastructure of Link3

# Anycast DNS deployment – can be summarized

- Address selection
- Host configuration
- Service configuration
- Network configuration
- Follow standard security measures
- Check and monitor the service

# Configuration - address selection

- Dedicated unique management IP for each host
- Designated 1 single /32 for Anycast address for all servers
- Private ASN 65430 for peering with ISP core

# Configuration – host part

- Hosts needed to be configured to accept traffic to anycast address
- A unique management IP address in each host
- Anycast addresses are configured as additional loopbacks
- Filtering for incoming traffic should be updated

# Zone-1 Server - assigned anycast address

Anycast address as an additional loopbacks

```
[root@dc-anycast-dns network-scripts]# ifconfig lo:0
```

```
lo:0: flags=73<UP,LOOPBACK,RUNNING> mtu 65536  
    inet 179.100.0.254 netmask 255.255.255.255  
    loop txqueuelen 1 (Local Loopback)
```

# Zone-1 Server - named service

Configuring named service to listen on anycast address

```
[root@dc-anycast-dns etc]# vim /var/named/chroot/etc/named.conf
options {
    listen-on port 53 { 127.0.0.1; 179.100.0.254; };
    directory      "/var/named";
    dump-file       "/var/named/data/cache_dump.db";
    statistics-file "/var/named/data/named_stats.txt";
    memstatistics-file "/var/named/data/named_mem_stats.txt";
    allow-query     { localhost; 192.168.0.0/16; };
    allow-query-cache { localhost; 192.168.0.0/16; };
    allow-recursion { localhost; 192.168.0.0/16; };
    version "go to sleep" ;
    recursive-clients 100000;
};
```

# Zone-1 Server - named service

## Configuring named service for separate query logging

```
logging {
    channel default_file {
        file "/var/named/chroot/var/log/named/default.log" versions 2 size 200m;
        severity dynamic;
        print-time yes;
    };
    channel queries_file {
        file "/var/named/chroot/var/log/named/queries.log" versions 2 size 4096m;
        severity dynamic;
        print-time yes;
    };
    channel resolver_file {
        file "/var/named/chroot/var/log/named/resolver.log" versions 2 size 200m;
        severity dynamic;
        print-time yes;
    };
    channel security_file {
        file "/var/named/chroot/var/log/named/security.log" versions 2 size 200m;
        severity dynamic;
        print-time yes;
    };
    category default { default_file; };
    category security { security_file; };
    category resolver { resolver_file; };
    category queries { queries_file; };
};
```

# Zone-1 Server - quagga & bgp

## Configuring zebra.conf

```
[root@dc-anycast-dns quagga]# # vim /etc/quagga/zebra.conf
```

```
hostname dc-anycast-dns.link3.net
```

```
!
```

```
enable password NothingToSay
```

```
!
```

```
interface eth0
```

```
ip address 192.168.0.226/30
```

```
!
```

```
interface lo:0
```

```
ip address 179.200.0.254/32
```

```
!
```

```
interface lo
```

```
!
```

```
line vty
```

```
!
```

# Zone-1 Server - quagga & bgp

## Configuring bgpd.conf

```
[root@dc-anycast-dns quagga]# vim /etc/quagga/bgpd.conf
hostname dc-anycast-dns.link3.net
password NothingToSay
log stdout
!
router bgp 65430
 network 179.200.0.254/32
 neighbor 192.168.0.225 remote-as 23688
 neighbor 192.168.0.225 description BTS
 neighbor 192.168.0.225 activate
 neighbor 192.168.0.225 next-hop-self
 neighbor 192.168.0.225 remove-private-AS
 neighbor 192.168.0.225 soft-reconfiguration inbound
 neighbor 192.168.0.225 prefix-list anycast out
 neighbor 192.168.0.225 prefix-list default in
!
ip prefix-list default seq 15 permit 0.0.0.0/0
ip prefix-list anycast seq 5 permit 179.200.0.254/32
```

# Zone-1 Router - announcing route

## Configuring BGP from router

```
router bgp 23688
network 192.168.0.224 mask 255.255.255.252
neighbor 192.168.0.226 remote-as 65430
neighbor 192.168.0.226 description DC-DNS_Anycast-SERVER
neighbor 192.168.0.226 activate
neighbor 192.168.0.226 next-hop-self
neighbor 192.168.0.226 default-originate
neighbor 192.168.0.226 remove-private-as
neighbor 192.168.0.226 soft-reconfiguration inbound
neighbor 192.168.0.226 prefix-list anycast-DNS-in in
neighbor 192.168.0.226 prefix-list default out
ip prefix-list anycast-DNS-in seq 10 permit 179.200.0.254/32
ip prefix-list default seq 5 permit 0.0.0.0/0
```

# Zone-2 Server - assigned anycast address

Anycast address as an additional loopbacks

```
[root@syl-anycast-dns network-scripts]# ifconfig lo:0
```

```
lo:0: flags=73<UP,LOOPBACK,RUNNING> mtu 65536  
    inet 179.100.0.254 netmask 255.255.255.255  
    loop txqueuelen 1 (Local Loopback)
```

# Zone-2 Server - named service

Configuring named service to listen on anycast address

```
[root@syl-anycast-dns etc]# vim /var/named/chroot/etc/named.conf
options {
    listen-on port 53 { 127.0.0.1; 179.100.0.254; };

ip prefix-list default seq 5 permit 0.0.0.0/0
```

# Monitoring the Anycast Service

Anycast is much better when you monitor the service and shutdown the routing announce when the DNS server is down.

It lets us know that something is wrong

```
#!/bin/bash
DNSUP=`usr/bin/dig @179.100.0.254 localhost. A +short`
if [ "$DNSUP" != "127.0.0.1" ];
then
echo "Stopping Anycast...."
systemctl bgpd stop
systemctl zebra stop
    echo "Stopped: Zone-1 Anycast DNS has stopped working, BGP has already been
        shutdown, Please check the system right now." | mailx -S
        smtp=smtp.notification.net:25 -s "Alert: Stopped – Zone-1 Anycast DNS
        has stooped working" nothing@notification.com
else
echo "Everything's good... Do nothing..."
fi
```

# Monitoring of Anycast Services

- Administration of all nodes through central management hosts on trusted LANs
- Each server has IPMI module accessible through the same management LANs
- Monitoring / alerting provided via a Nagios infrastructure already is in place
- DNS measurements from BIND is also added at Nagios NMS.
- PnP4Nagios is in place for graph representation with Nagios

# Security Measures

- Hide the bind version

```
[root@bd-anycast-dns etc]# cat /var/named/chroot/etc/named.conf  
version "please don't ask my name" ;
```

- Install & Configure the named service with least privileges CHROOT

```
[root@bd-anycast-dns quagga]# cd /var/named/chroot/ && ls  
dev  etc  run  usr  var
```

- Restrict queries

```
[root@bd-anycast-dns etc]# cat /var/named/chroot/etc/named.conf  
allow-query      { localhost; 192.168.0.0/16; };  
allow-query-cache { localhost; 192.168.0.0/16; };  
allow-recursion { localhost; 192.168.0.0/16; };
```

- Named service was configured to Listen to only Anycast Address

```
[root@bd-anycast-dns etc]# cat /var/named/chroot/etc/named.conf  
listen-on port 53 { 127.0.0.1; 179.100.0.254; };
```

# Output of Anycast DNS Infrastructure

- serving 822 million queries / Day
- with 5 Caching DNS server

# Output of Anycast DNS Infrastructure

Success and Failure ratio

Query Request 570,834/minute

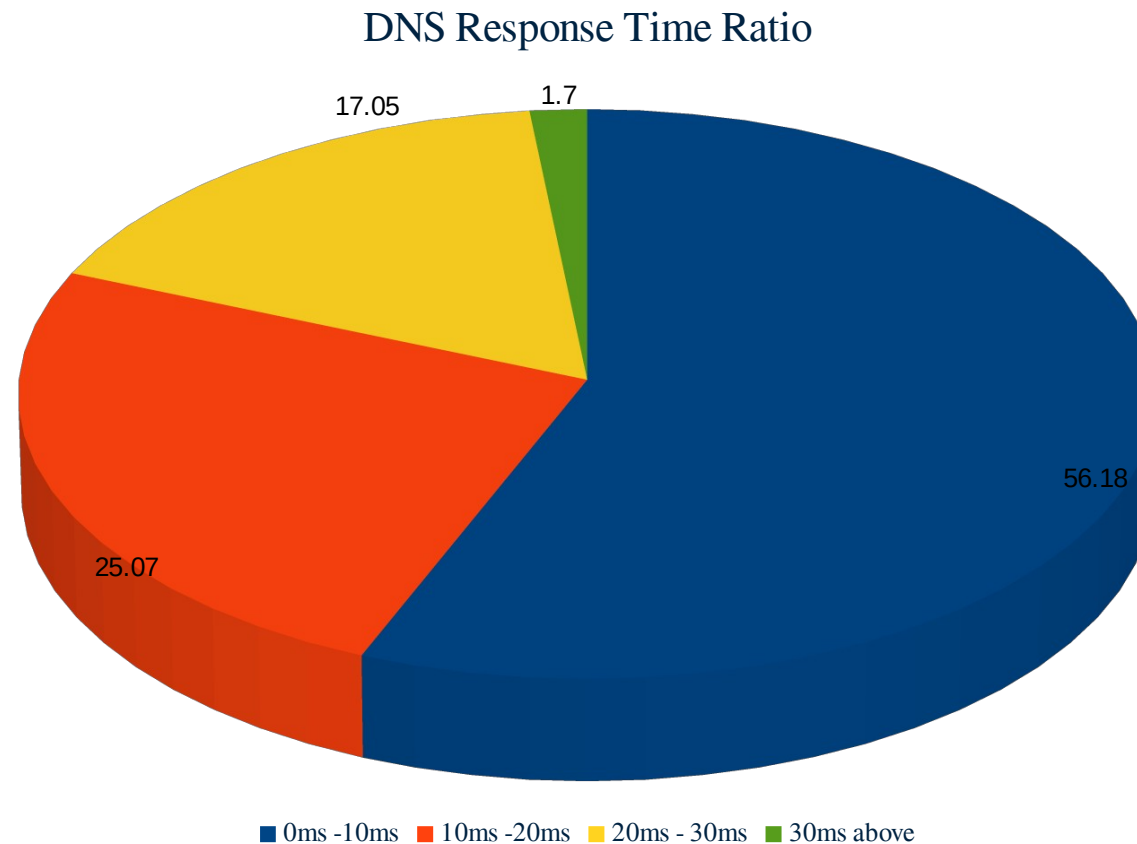

# Output of Anycast DNS Infrastructure

DNS Failure Reason

# Output of Anycast DNS Infrastructure

DNS Resolution Time

**Thank You**
